Introduction

PetPlan is an all-inclusive, one stop place for all information about your pet. It is meant for users who own pets, but also for veterinarians who want to give pet owners an easier way to register and trainers who want to use PetPlan for scheduling.

Because Estonia is lacking a universal pet healthcare system this would be a way for different vets to access information about a specific pet written from other veterinarians, and in general access information about a new pet coming to a specific practice. Of course, the veterinarians should have listed with PetPlan to get access.

For pet owners the main functions of the application are accessing info from vet visits about their pet(s), creating training plans for their pets (either with the help of a trainer or their own), get the ability to schedule appointments with vets or trainers through PetPlan.

For trainers the functions are meeting new clients and the ability to either share their already made training plans or just create new individual exercises.

1 Application overview

1.1 Use cases for the application

This application is meant for pet owners who want to hold all information about their pet(s), in the same place.

Functionalities designed for pet owners:

- Dashboard where you can see upcoming appointments for you pet, todays training plan and a few fun articles about the specified pet.
- Registration for veterinarian appointments and training sessions
- Health logs about your pet
- Read the blog page.

This application is also meant for trainers who want to promote themselves for pet owners and plan their work out sessions with pets.

Functionalities for trainers include:

- Ability to register new clients or returning clients for sessions.
- Make training plans for your clients.
- Publish new exercises with detailed instructions and level.
- Publish articles to the blog page.

This page is also meant for veterinarians who want to participate in a more universal health care system for pets.

Functionalities for veterinarians:

- Insert health logs for pets.
- Get registrations thorough petplan.

- See other veterinarians info about a specific pet.

There is also a place where pet owners can rate veterinary practices and vets and trainers.

Blog and the exercises can be also accessed without an account.

1.2 Database design

The database of the system is designed to hold users, pets, blogposts, appointments related to the pet, veterinary practices, exercises and health logs. Entity relationship diagram can be found in Appendix 1

1.3 User experience

In appendix 2 is an example of what the landing page of the website looks like. It composes of a header with options to register your veterinary practice, accessing the blog, list of exercises and the ability to log in. there is also a big button that gives the user the access to register themselves as a user.

In appendix 3 there is an example of the logging in process. The user needs to input their username and password to access their account.

In appendix 4 there is an example of the registration page. It asks the user for some information to create the account and to make a choice who they want to register as.

Appendixes 5 and 6 show what is the next step in registration based on what decision was made in the step before (pet owner, veterinarian). Since trainers do not need to provide more information about themselves there is no need for an additional page for that option.

Appendix 7 shows the example of how to register a veterinary practice. While creating their veterinary profile the veterinarians need to affiliate themselves with a clinic as well.

Appendix 8 shows an example of the blog page with some blog entries. The blog page also comes equipped with a search bar and some topic choices. Appendix 9 shows a blog post open.

Appendix 10 shows the exercise page. It comes equipped with a search bar and a filter option based on the level of the exercise. Appendix 11 shows the exercise page open.

Appendixes 12-14 show dashboards based on which role you hold.

Mary Smith, vet

If food is your love language, it makes sense that you'd want to share your delicious delicacies with your fur baby. While many human foods are safe for dogs, others are very unhealthy and dangerous, so it's important to learn which fruits and vegetables dogs can eat.

It's just as important to find out if your dog has any allergies. This is especially essential during the holidays, where many celebrations revolve around lots of food many of which can be harmful to your pet. The same is true for dog food, you should understand what is in your dog's food, and to do so you must know how to understand a dog food

How Do I Teach the Come Command?

1. In the beginning, show your pup a high-value treat. A small piece of chicken or a purchased treat that your dog can't resist can lure even reluctant dogs. Some treats that worked great with my dogs: hot dogs, cheese, steak, and really stinky fish treats.
2. Make sure you use something he really likes. Then, say his name and "Come!" in a happy tone.
3. When teaching this, you can first show him the treat as a lure then give the command.

Appendix 13 Dashboard – veterinarian

The dashboard features a top navigation bar with 'PetPlan' on the left, 'Blog', 'Exercises', and 'Profile' on the right. A vertical sidebar on the left contains menu items: 'Bookings', 'Health logs', 'Calender', 'Practice info', and 'User info'. The main content area is titled 'Hello vet Lisa!' and contains two primary widgets. The 'Today's appointments' widget lists five appointments: Mimmu, dog (10.00-10.30); Mikki, cat (11.00-11.30); Säde, dog (11.45-12.15); Saskia, bird (12.30-13.00); and Indy, dog (14.00-14.30). The 'Health logs' widget is currently empty and includes a '+ add new' button.
