# 1 Introduction

Fish tracker app allows users to record their real life catches and also catches from fishing games. The idea came from a fishing game called Russian Fishing 4. Game has quite a big community and fishing spots are shared on its official discord server. Spots are shared by posting screenshots of the fish, equipment used and the location. This gets the job done of recording the catches, however, it is really hard to later find older spots, big catches or even what tackle was used to catch a specific fish.

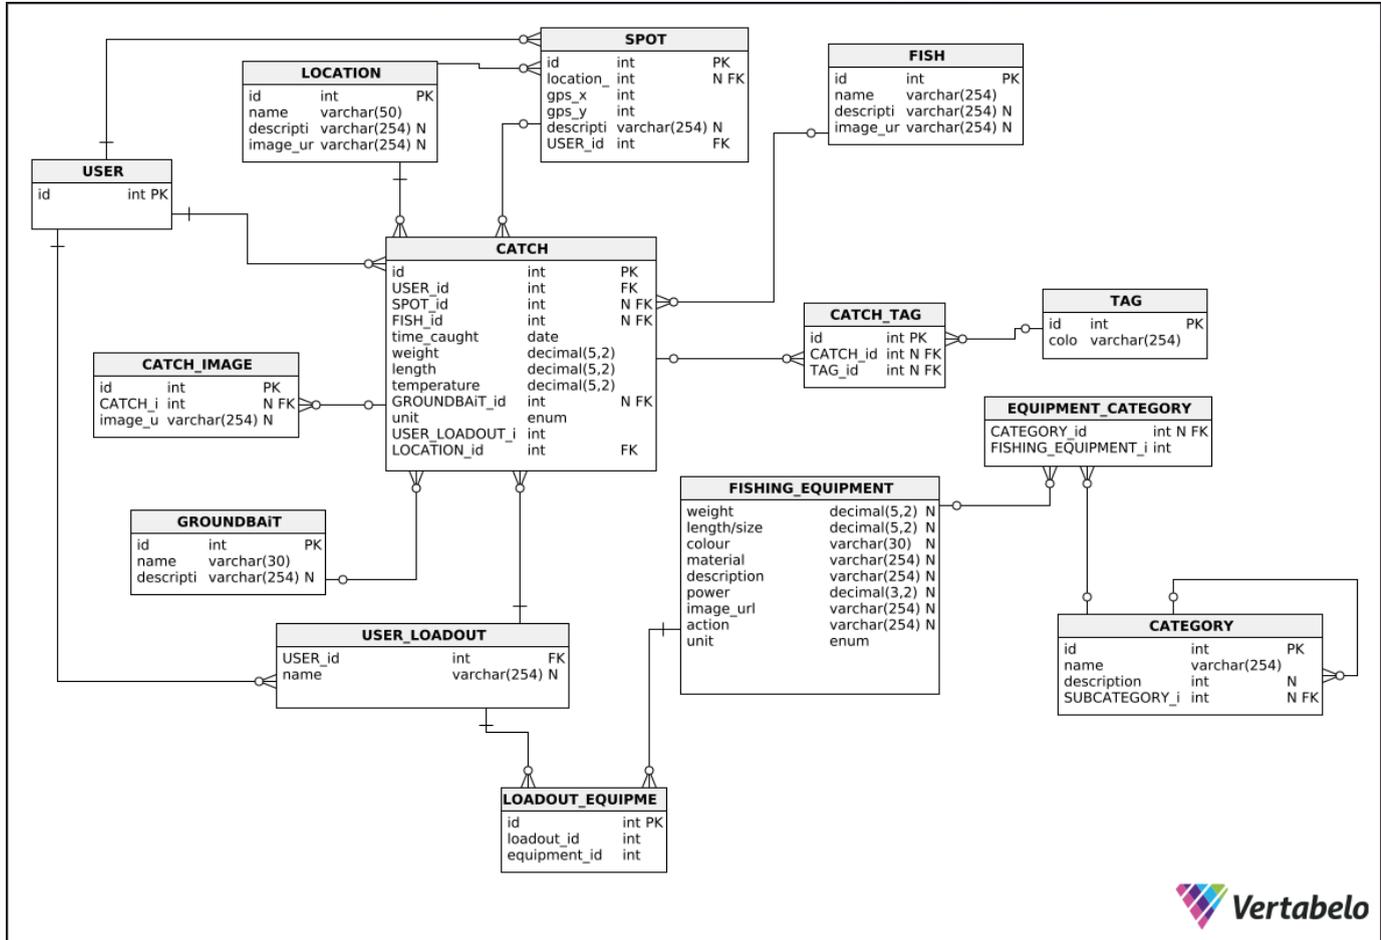

The web app under development should allow you to group fish and tackle used to catch it. Searching and sorting is also possible and saving the catch is also easier because users can select premade fishing loadouts to link to their catch. Adding screenshots/images is also possible.

To fulfill this work, the author will create an ERD schema, a database, and build application layers respectively to the lecturers requests and wishes.

## **2 Scope of work**

Users can add their own fishing equipment, mark their fishing spots and add their catches to them. It is also possible to move catches from one spot to another. It is possible to link groundbait and equipment used to specific catch to later sorting. Users can filter catches by weight, length, species name but also by tags which are custom made. Some examples of tags are: Personal best, trophy fish, super rare trophy. Users can add images of their catches and loadouts/baits. Every fish has its own description.
